## Recombinant Antibodies: Applications in Plant Science and Plant Pathology

The first part of this book combines basic information on antigens and antibodies with a review of technologies for both the development of recombinant antibodies and their application. The principles involved in producing recombinant antibodies from either pre-existing monoclonal antibodies or from phage display libraries are introduced with practical examples. Modern methods for the analysis of antibody binding properties are described in detail. Examples are given in the second part of this book for the application of recombinant antibody technology to antibody-mediated resistance to plant disease and immunomodulation of plant antigens. The potential of antibody-expressing plants as bioreactors for large-scale production and storage of recombinant antibodies is described and a future outlook given.
